Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1-40. (Canceled)

41. (Previously Presented) An apparatus for manufacturing a color filter, comprising:

a plurality of ejection heads which are arranged perpendicular to a head scan direction arranged on a print head, each ejection head having a plurality of nozzles for ejecting a filter material in droplets, the plurality of nozzles linearly arranged with a constant layout pitch of (D), the plurality of ejection heads are arranged on the print head to form at least one linear row of nozzles arranged perpendicular to the head scan direction,

wherein at least one of the plurality of ejection heads comprises a plurality of first nozzles for ejecting a first type of filter material, a plurality of second nozzles for ejecting a second type of filter material, and a plurality of third nozzles for ejecting a third type of filter material, the plurality of first, second and third nozzles arranged in a same line.

42. (Previously Presented) An apparatus for manufacturing an electroluminescence substrate, comprising:

a plurality of ejection heads which are arranged perpendicular to a head scan direction arranged on a print head, each ejection head having a plurality of nozzles for ejecting a filter material in droplets, the plurality of nozzles linearly arranged with a constant layout pitch of (D), the plurality of ejection heads are arranged on the print head to form at least one linear row of nozzles arranged perpendicular to the head scan direction,

wherein at least one of the plurality of ejection heads comprises a plurality of first nozzles for ejecting a first type of filter material, a plurality of second nozzles for

ejecting a second type of filter material, and a plurality of third nozzles for ejecting a third type of filter material, the plurality of first, second and third nozzles arranged in a same line.

43. (Previously Presented) A method for manufacturing a color filter, comprising:

scanning a substrate by moving a table and a plurality of ejection heads which are arranged perpendicular to a head scan direction arranged on a print head; and

ejecting a plurality of types of filter material in droplets by the plurality of ejection heads, each ejection head having a plurality of nozzles arranged with a constant layout pitch of (D), the plurality of ejection heads being linearly arranged to form at least one linear row of nozzles which is arranged perpendicular to the scan head direction,

wherein at least one of the plurality of ejection heads comprises a plurality of first nozzles for ejecting a first type of filter material, a plurality of second nozzles for ejecting a second type of filter material, and a plurality of third nozzles for ejecting a third type of filter material, the plurality of first, second and third nozzles arranged in a same line.

44. (Previously Presented) A method for manufacturing an electroluminescence substrate, comprising:

scanning a substrate by moving a table and a plurality of ejection heads which are arranged perpendicular to a head scan direction arranged on a print head; and

ejecting a plurality of types of functional layer forming material in droplets by a plurality of ejection heads, each ejection head having a plurality of nozzles arranged with a constant layout pitch of (D), the plurality of ejection heads being linearly arranged to form at least one linear row of nozzles which is arranged perpendicular to the head scan direction,

wherein at least one of the plurality of ejection heads comprises a plurality of first nozzles for ejecting a first type of functional layer forming material, a plurality of second nozzles for ejecting a second type of functional layer forming material, and a plurality of third

nozzles for ejecting a third type of functional layer forming material, the plurality of first, second and third nozzles arranged in a same line.

45. (New) An apparatus for manufacturing a color filter as described in claim 41, wherein the plurality of first, second and third nozzles are arranged in one of the linear row of nozzles arranged perpendicular to the head scan direction.

46. (New) An apparatus for manufacturing an electroluminescence substrate as described in claim 42, wherein the plurality of first, second and third nozzles are arranged in one of the linear row of nozzles arranged perpendicular to the head scan direction.

47. (New) A method for manufacturing a color filter as described in claim 43, wherein the plurality of first, second and third nozzles are arranged in one of the linear row of nozzles arranged perpendicular to the head scan direction.

48. (New) A method for manufacturing an electroluminescence substrate as described in claim 44, wherein the plurality of first, second and third nozzles are arranged in one of the linear row of nozzles arranged perpendicular to the head scan direction.
